Front side motor mount

Designed in Fusion360 by John van Oers
V1.0

This front side motor mount is designed for the MK3 body created by MrBaddeley. The design is made to work with the modular electronics panel that can be removed easy without the original motor mount in the way.

When using this motor mount you will have to glue in the two side holders, they have to be flush with the body gripper arms back wall and make sure they do not come above it (due to installing the top cover of the compartment).

After fixing the side holders, install the main bar, the slipping holder and finally the motor mount. Turn the dome motor to make sure it is installed correct. Its possible to adjust the main bar and motor holder hight co correct for the hight and spacers used for the lazy susan.

Print parts:

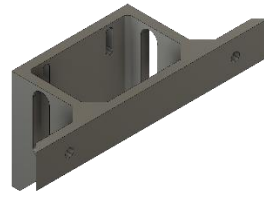

Left holder

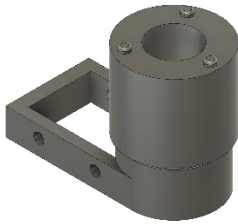

Right holder

Main bar

Motor mount

Slip ring holder
